

HCI HAPPY LIBRARY CANONICAL V1

Canonical exercise library for the HCI HAPPY Prescription Engine.

Engine Flow

HAPPY INPUT -> DIMENSION ENGINE -> GAP DETECTION -> CRITICAL PARAMETER -> HAPPY LIBRARY
-> PRESCRIPTION -> DEVELOPMENT PLAN -> REASSESSMENT

Selection Policy

- Primary selection: lowest dimension score.
- Secondary selection: lowest weighted parameter inside the dimension.
- Tie-breakers: lowest parameter value, largest perception gap, coach priority, competition proximity.
- The dashboard displays. The engine decides. The library prescribes.

Severity Bands

Score	Status	Prescription Load
1.0-1.99	CRITICAL	3 exercises, coach follow-up required
2.0-2.99	ATTENTION	2 exercises, review next session
3.0-3.99	STABLE	1 maintenance exercise
4.0-4.49	HIGH_PERFORMANCE	reinforcement only
4.5-5.0	ELITE	protect and monitor

Canonical Exercise Entries

CONFIDENCE

Name	Objective	How to do
Performance Evidence Journal	Build confidence from real performance evidence, not from motivation alone.	After each training session, the athlete records 3 objective evidences of capability: a good series, a corrected mistake, a stable routine, or a pressure moment handled well. Review before key sessions.
Success Replay	Reactivate a proven competitive state.	The athlete selects one successful match, series, or technical block and mentally replays posture, breathing, focus, rhythm, and decision quality for 3-5 minutes before training.
Confidence Anchor	Create a quick trigger for competitive confidence.	Recall a strong performance. At the emotional peak, use a consistent gesture and cue word. Repeat 5 times. Use the same anchor before pressure blocks.

ORGANIZATION

Name	Objective	How to do
Training Week Map	Organize the week around the athlete objective.	At the start of the week, athlete and coach define training days, recovery, technical focus, mental focus, and one non-negotiable habit. Athlete confirms daily completion.
Pre-Session Checklist	Reduce friction before practice.	Before training, athlete checks equipment, hydration, arrival time, training objective, warm-up, and data recording method. Missing items are marked for coach follow-up.
Routine Audit	Find routine breakdowns that affect consistency.	Once per week, compare planned training with actual training. Identify missed sessions, late starts, sleep problems, or equipment/logistics issues.

MANAGEMENT

Name	Objective	How to do
Execution Contract	Convert the plan into visible execution.	Before training, athlete writes: today I will execute X, measure Y, and adjust Z. After training, mark done/partial/not done and explain one reason.
Plan-to-Action Review	Check whether coach planning is becoming athlete execution.	At the end of the session, athlete reports what was planned, what was executed, what was skipped, and what needs adjustment.
Daily Process Score	Prioritize process over result.	Athlete scores process execution from 1 to 5 after training and writes one behavior to repeat next session.

ANALYSIS

Name	Objective	How to do
After Action Review	Transform training into learning.	After training, answer: What was the objective? What happened? Why did it happen? What will I repeat? What will I change?
Error-to-Data Reframe	Prevent mistakes from becoming identity.	When a bad shot or poor series appears, athlete writes it as data: trigger, rhythm, posture, arousal, focus, or decision. Then chooses one correction.
Learning Log	Track recurring lessons.	At the end of the week, athlete lists the 3 most repeated lessons and coach assigns one technical or mental priority for the next block.

NERVE

Name	Objective	How to do
Pressure Reset Routine	Recover after error under pressure.	Use one breath, one posture reset, one cue word, and one process instruction before the next shot/block. Train it after intentional pressure simulations.
Pressure Simulation Ladder	Build tolerance to competitive pressure.	Coach creates blocks with increasing constraints: score target, time limit, public counting, consequence, or final-shot scenario. Athlete must keep process routine stable.
Emotional Control Window	Identify when pressure enters the sequence.	After each block, athlete marks if pressure appeared before the first shot, during execution, after an error, or at the end. Coach links it to intervention.

DISCIPLINE

Name	Objective	How to do
Non-Negotiable Habit	Strengthen consistency through one daily action.	Choose one small daily behavior connected to the objective. Track completion for 14 days. Missed days require a short cause note, not punishment.
Minimum Session Rule	Protect continuity on low-motivation days.	When the athlete cannot complete full training, execute a minimum version: 10 minutes dry-fire, 10 technical reps, or one mental routine. Keep the chain alive.
Commitment Review	Reconnect behavior to declared objective.	Once per week, compare objective, completed sessions, missed actions, and recovery discipline. Athlete chooses one correction for the next week.

OPPORTUNITY

Name	Objective	How to do
Feedback Utilization Log	Ensure coach feedback becomes action.	After receiving feedback, athlete writes the instruction, the next drill where it will be applied, and the evidence that will show improvement.
Opportunity Scan	Recognize growth chances in the environment.	Weekly, athlete lists available opportunities: coach feedback, competition, sparring, data review, video, equipment check, or recovery. Select one to use.
Coach Question Practice	Increase active learning.	Before coach review, athlete prepares one specific question about technique, pressure, routine, or execution. Coach answers and assigns an action.

HEED

Name	Objective	How to do
Arousal Awareness Log	Improve awareness of competitive arousal before, during, and after performance.	Athlete rates arousal 1-5 before training, mid-session, and after. Add one note: too low, optimal, or too high. Compare with rhythm and pressure data.
Optimal Competitive Arousal Routine	Reach the athlete optimal arousal zone.	Before training or competition, athlete adjusts breathing, posture, visual focus, internal dialogue, and attentional cue. Then rates readiness from 1 to 5.
Pre/Post Check-In	Connect internal state to performance evidence.	Answer quickly before and after training: arousal, focus, confidence, body tension, and perceived readiness. Coach compares with actual performance indicators.

ALIGNMENT

Name	Objective	How to do
Coach-Athlete Alignment Session	Clarify what the athlete must do to approach the objective.	Once per week, coach and athlete define the main objective, the reason behind it, the key action, and how success will be measured.
Training Direction Card	Convert strategy into a simple athlete instruction.	For each session, coach provides one sentence: today the priority is __ because __. Athlete repeats it in their own words before starting.
Misalignment Flag	Detect when the athlete does not understand the plan.	If ALIGNMENT <= 2 or PLAN <= 2, athlete must write what is unclear. Coach resolves with one technical objective and one measurable criterion.

PLAN

Name	Objective	How to do
Plan Fit Review	Check whether the coach plan fits the athlete reality.	At the end of the week, athlete rates plan fit 1-5 and identifies barriers: time, fatigue, clarity, equipment, pressure, or recovery. Coach adjusts if needed.
Plan Adherence Sheet	Measure adherence without blame.	For each planned session, mark completed, partial, missed, or modified. Add one reason and one next action.
Plan Confidence Check	Detect resistance to the process.	Athlete answers: Do I understand the plan? Do I believe it fits the goal? Can I execute it this week? Scores below 3 trigger coach conversation.

POWERING

Name	Objective	How to do
Energy Investment Score	Measure how much energy the athlete is applying to the plan.	Before and after training, athlete rates energy investment 1-5. Coach compares with physical degradation, rhythm, and pressure indicators.
Activation Block	Raise energy without losing precision.	Use a short warm-up sequence: posture, breathing, mobility, visualization, and one technical dry-run. Finish when arousal is ready but not excessive.
Effort Quality Review	Separate effort from useful effort.	After training, athlete answers: Was my energy directed to the correct task? Did I rush, force, or stay precise? Choose one adjustment.

YEARN

Name	Objective	How to do
Goal Contract	Convert long-term desire into visible commitment.	Athlete writes the season objective, why it matters, what must be sacrificed, and the weekly minimum behaviors required. Coach reviews monthly.
Time Audit	Compare ambition with actual dedicated time.	For 7 days, athlete records time spent on training, recovery, analysis, physical preparation, and distraction. Compare with stated goal.
Champion Mindset Statement	Make the objective emotionally clear.	Athlete writes a short statement: what I am pursuing, why I want it, what I will do when motivation is low, and what I will stop doing.
