

Lovelesh Methodology Report - Air Pistol 60

Athlete: PRARTHANA BHAT. Source set: SIUS overview, shot strings by series, and grouped target image. The official series table comes from the SIUS screen. Directional sectors and the radial chart were estimated from the grouped target image under the approved Lovelesh methodology.

Method note: the score table is official; the 8-sector directional percentages are image-based estimates because no raw shot-coordinate export was provided.

Official Match Summary

Series	Score	Official metric	Value
SR1	98	Decimal total	605.4
SR2	94	Inner tens	20
SR3	95	MPI X	-1.2 mm
SR4	99	MPI Y	-1.3 mm
SR5	98	Group size	32.6 mm
SR6	98		
Total	582		

Shot-by-Shot Competition Table

Series	T1	T2	T3	T4	T5	T6	T7	T8	T9	T10	Sum
SR1	10x	10	10	9	10	10x	10x	9	10x	10x	98
SR2	9	10	9	9	10	10x	10x	9	9	9	94
SR3	9	10	9	9	10	10	9	10x	9	10x	95
SR4	10x	9	10	10	10x	10	10	10	10	10x	99
SR5	10x	10x	10x	10x	9	10	10	10	9	10x	98
SR6	10	9	10x	10x	10	10x	10	10	10	9	98

8-Sector Directional Analysis

The grouped target image was classified into the standard pistol sectors: 0, 45, 90, 135, 180, 225, 270, and 315 degrees. The dominant measure is the estimated %IDD_MEDIO of each sector.

Angle	Direction	%IDD_MEDIO (est.)
0°	Right	6.1%
45°	Upper right	3.9%
90°	Up	9.7%
135°	Upper left	14.4%
180°	Left	12.7%
225°	Lower left	1.5%
270°	Down	48.9%
315°	Lower right	2.7%

Directional Ranking

Rank	Angle	Direction	%IDD_MEDIO	HCI reading
1	270°	Down	48.9%	Primary dominant error
2	135°	Upper left	14.4%	Secondary support zone
3	180°	Left	12.7%	Left-side reinforcement
4	90°	Up	9.7%	Minor upper balance effect
5	0°	Right	6.1%	Low side influence
6	45°	Upper right	3.9%	Residual contribution
7	315°	Lower right	2.7%	Residual contribution
8	225°	Lower left	1.5%	Lowest contribution

Interpretation

Insight 1. The target shows a strong downward directional bias. Almost half of the estimated directional weight falls in the 270-degree sector, which is the clearest sign of collapse or loss of support during the last phase of the shot.

Insight 2. The next relevant sectors are upper left and left. This suggests the athlete is not only dropping the shot; there is also a left-side steering or tension component, possibly linked to trigger pressure, anticipation, or an inconsistent follow-through path.

Main exercise. Dry-fire with follow-through and pressure continuity. Lift the pistol, settle into the aiming area, build pressure without interruption, and after the click keep the sights stable for 2 full seconds before lowering the arm. Suggested volume: 30 dry-fire repetitions, then 20 live shots using the same rule.

Key phrase: the trigger keeps moving, and the shot finishes only after the sights stay quiet.

Visual Evidence and Radial Chart

The overview screen confirms the official total and match metadata. The grouped target crop was used to estimate directional balance under the Lovelesh methodology.

Radial summary: the 270-degree ray is dominant, while 135 degrees and 180 degrees form the main secondary support band. The grouped target therefore reads as a predominantly low pattern with a left-side technical component.

Evidence note: supporting shot-string screenshots were reviewed to close the 60-shot score table and confirm the official series totals of 98, 94, 95, 99, 98, and 98.
